

Athena Phase 1 PRD, Intake

Overview

Athena Phase 1 includes two critical components:

1. Intake from AthenaOne to HealthSource
2. Digital Fulfillment of Pat & COC requests

This PRD focuses on the Intake component. The PRD for Digital Fulfillment is [here](#) with more detail [here](#), owned by Provider Digital Connections

Background / Problem Statement

Athena requires a way to submit medical record requests directly into Datavant's fulfillment ecosystem. Today, Athena lacks an automated way to preprocess request letters (various formats) and seamlessly route them through Datavant's OCR and fulfillment pipeline. As part of our partnership with Athena, we will build a pipeline that provides Athena with an API interface to send requests with unstructured data. This workflow introduces:

- Requester API intake with validation and preprocessing.
- ROI Platform orchestration as the interface into STORK and fulfillment.
- STORK OCR expansion to support multiple file formats and structured extraction.

Dependencies

Team	Need	EM/PM	Primary Eng
RequesterAPI	Intake, validation, ROI Platform API callout	Steve Paula/Khristina Butenko	
ROI Team	Interface to STORK, artifact creation, tracking IDs, fallback logic	Jim Bartolotta, John Blythe	
STORK	OCR Model Retraining	Austin Jordan	

See staffing model [here](#).

Business Impact

- Faster request intake and fulfillment turnaround for providers

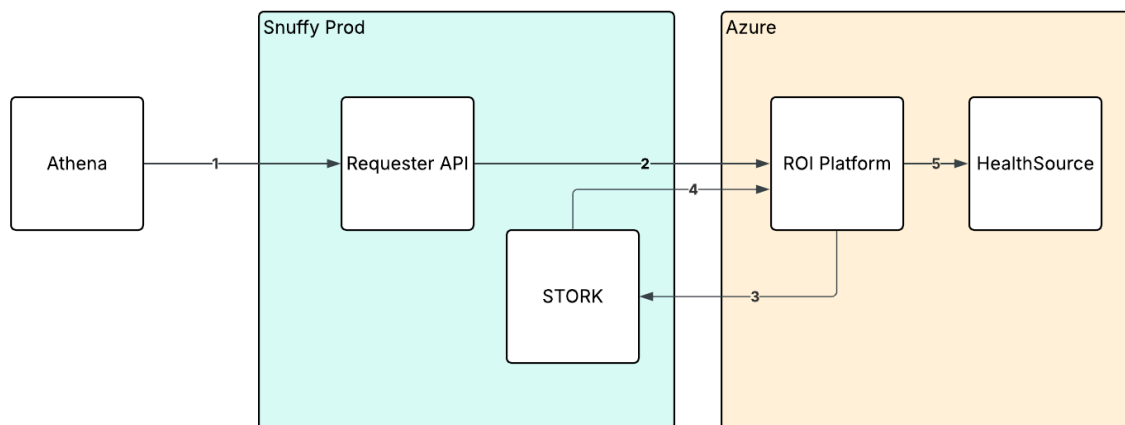

- Reduced manual intervention (less ROI staff logging requests)
- Demonstrates value prop of partnership between Athena and Datavant

Goals & Success Metrics

- Successful end-to-end flow for requests originating from AthenaOne Inbox tagged as “Medical Records” to fulfilled record delivered to requester
- Maintain SLA parity with existing ROI Platform workflows.

Development

Solution Overview

Workflow (happy path):

- Step 1 – Intake
 - Athena calls Requester API with:
 - Request Letter (PDF, PNG, or TIFF)
 - Patient ID
 - Department ID
- Step 2 – Orchestration
 - Requester API forwards the request to ROI Platform.
 - ROI Platform creates artifacts and tracking IDs, and triggers STORK for OCR.
- Step 3 – OCR
 - STORK uses AWS Textract to extract structured data (patient name, DOB, reason, criteria).
 - STORK normalizes the data and calls HealthSource API to create the request.
- Step 4 – Fulfillment
 - ROI Platform determines if the request can be fulfilled digitally.
 - If yes → digital retrieval.

- If no → manual fulfillment team retrieves the chart.
- Step 5 – Delivery
 - HealthSource delivers the chart to Athena via existing fulfillment workflows.

Error / Off-ramp Handling:

Failure Point	Behavior
Missing Patient ID, Dept ID, or Request Letter	400 response from Requester API
Unsupported file type / oversized file	Request sent to manual logging
OCR fails to extract required fields	Request sent to manual logging
Manual logging fails	Correspondence letter sent
Fulfillment exception	Request marked PEND in HealthSource

Product Requirements / Features

Requester API

Owner: Khristina Butenko Steve Paulo

PRD: Requester API for Athena

Tech Spec: athena_draft_create_request_schema

Requirements:

- Endpoint to create request with unstructured data
 - Accept request letters (PDF/PNG/TIFF) + metadata.
 - Validate required fields (return 400 on missing/invalid).
- Interface to ROI Platform
 - Send unstructured data (PDF, PNG, etc) to ROI Platform, and let ROI platform know it needs to go through STORK

ROI Platform / HealthSource

Owner: Jim Bartolotta John Blythe

PRD: **WIP**

Tech Spec: **WIP**

Requirements:

- Interface to accept unstructured data
 - Add/Modify Clarity **Create Request** endpoint for Requester API to call

- Create artifacts + tracking IDs for traceability.
 - Ingest Patient ID, Patient Name, ensure those override STORK OCR'd data
- Expand STORK Pipeline
 - Extend support to handle PNG and TIFF (currently only PDF)
 - OCR request letter using AWS Textract
 - Postprocess extracted data to standard fields
- Create Request Workflow
 - Receive OCR results from STORK and create requests in HS
 - Route requests to fulfillment (digital or manual)
 - Handle exceptions (e.g., assign PEND status)
- Update Stork FLOG dashboard to monitor STORK logging for Athena

Timeline

TBD

Future Considerations

The following features are not in scope for the completion of Phase 1 but can be considered as part of the design:

- Improved STORK performance - Process requests at a faster speed (P99 is 20 mins currently)
- Statusing - Implement manual fallbacks and or additional statusing

Question

- What to do when we have requesters that are not in our database?
- How to track status of charts going through STORK and measure effectiveness?
- Update STORK Dashboard to get advanced notice of issues (ROI Product side)
- Check with Requester on the source of truth for requester database

Reference Notes

Req API

- Send unstructured data (PDF, PNG, etc) to ROI Platform, and let ROI platform it needs to go through STORK
 - May need to be a new endpoint, but minimal effort

Stork Work

- Support TIFF and PNG
 - (will be owned by whoever owns textract)
 - Likely ROI team, not Austin's team
- Infer information about the request, push into HealthSource Auth Review
- Finetune model to support more digital
- Finetune model to ensure the requester logging success is correct
- We need a way to call Stork and send it PDF, PNG and TIFF files -> PNG and TIFF support is new
- We need stork to OCR and inference on all the required fields for HS to send the doc to auth review -> stork may or may not infer all these fields or do them well so might need some fine tuning and training
- Update Stork FLOG dashboard to monitor STORK logging for Athena
- [Maybe] We need Stork to process these requests at a faster speed then regular -> P99 is 20 mins currently

HealthSource Work

- "Create Request" Support intake of requests (to be put in Auth Review step) with just 3 identifiers from Athena
 - We need a way to send the collected information from Stork and additional info to HS to create a request even if some of the required fields are missing
 - Discovery Owner: John Blythe
 - Ingest Patient ID, Patient Name, ensure those override STORK OCR'd data
 - [Maybe] There might be some additional work HS side to implement manual fallbacks and or additional statusing

Alerting for Athena - no volume
