

Requirements for ROI team in Athena Phase 2

Purpose

This document describes the capabilities and integration points that the Athena Phase 2 Integrated ROI Experience requires from the HealthSource/ROI Platform.

It is intentionally not prescriptive about implementation (API shape, data model, workflow orchestration, etc.). Instead, it outlines what must be possible, leaving HealthSource free to design the most scalable and maintainable implementation.

-  [Tech Spec - Embedded ROI EHR Integration \(Athena\)](#)
- [PRD](#)
- [LucidChart Workflow](#)

Context

Athena Phase 2 enables provider users to:

- View all ROI requests associated with their Athena practice
- Quickly identify requests requiring practice action
- View request details and associated documents
- Take action on exception workflows:
 - **Certification** (certify that provider is custodian of records)
 - **Practice Review** (sensitive data, subpoenas, etc.)
 - **Practice Retrieval** (manual record upload)

Phase 2 builds on Phase 1 functionality (intake + digital fulfillment). This phase requires deeper, bi-directional integration between Athena and HealthSource.

High-Level Capabilities Needed From HealthSource

HealthSource must enable the SMART app to:

1. **Retrieve request lists** filtered by practice and/or exception status including **searching** by patient name and dob
2. **Retrieve detailed request information** for a given request, including documents

3. **Submit exception-management actions** to update request state in HS, including uploading documents
4. **Record audit-trail events** initiated by Athena users
5. **[TBD] Map Athena practices to HS Site IDs** (not sure if this should live in HS or not)

Each capability is described below.

Capability Details

1. Retrieve Request Lists

athenahealth
datavant ROI

Use this page to review and manage requests that require additional action before they can be delivered. Select a request to view details, update information, or complete the next step.

Exception ▲ All Requests

Requests in this queue need additional action before fulfillment.

Search by Patient Name, Patient DOI, Request ID

Exception Status A Request Type B

Due Date	Patient Name DOB	Request ID	Request Type	Requester	Exception Status
4/16/2025 4 days late	John A. Smith 07/14/1980	8983712	Attorney	[Requester name]	Pending Approval
4/16/2025 Today	John A. Smith 07/14/1980	8983712	Attorney	[Requester name]	Pending Approval
4/16/2025 Tomorrow	John A. Smith 07/14/1980	8983712	Attorney	[Requester name]	Pending Approval
4/19/2025	Gordon Okuneva 05/23/1970	8983333	Attorney	[Requester name]	Pending Approval
4/20/2025	Charlie Buckridge 11/25/1994	8980098	Copy Service	[Requester name]	Pending Approval
4/21/2025	Phil Kutch 02/26/1976	8981223	Attorney	[Requester name]	Pending Approval
4/21/2025	Phil Kutch 02/26/1976	8981223	Attorney	[Requester name]	Certification Needed
4/21/2025	Phil Kutch 02/26/1976	8981223	Attorney	[Requester name]	Record outside Athena

Figma DRAFT of App List page

The SMART App must be able to retrieve request lists for a given Athena practice, with consistent search and filter capabilities across both:

- All Requests view
- Exception Requests view

The SMART App needs to support search and filtering (across both the All Requests and Exception Requests views. For performance reasons, we would want the ability to search & filter directly on the server (HS) side, rather than the client side.

The list view must support returning requests in a way that enables the app to present high-priority/exception items first. The SMART App can handle sorting, but HS must supply the

necessary status/pend information to compute priority or enable filtering for it.

Inputs (from SMART App → HealthSource)

- Athena practice identifier (or mapped HS Site IDs)
- Searchable fields
 - Patient Name
 - Patient DOB
 - Request ID (erequest_id)
 - Requester Name
- Filterable fields
 - Request Type
 - Status (regular or exception statuses)

Expected Behavior

- Search should apply across all requests returned for that practice (or across exception-only requests, depending on which list is being rendered).
- Search is non-prescriptive: HS may implement fuzzy, exact, or prefix matching, but must support these three fields.
- The SMART app may combine filters + search together (e.g., filter by request type and also search by patient name).
- The same search behavior must be available for:
 - All Requests list
 - Exception Requests list

Outputs (from HealthSource → SMART App)

For each matching request, HS must return:

- Status
- Patient Name
- Patient DOB
- Request ID
- Request Type
- Requester Name
- Due Date (this will be a key field for sorting)
- Pend Reason / Exception Reason (if applicable)

Search and filters should not alter the presence of required fields.

Additional Expectations

- Endpoint should support frequent polling (Providers must be alerted to requests they need to take action on, exact frequency TBD, perhaps on the order of hourly?)
- Returned list should be complete for all relevant HS Site IDs mapped to the practice

2. Individual Request Detail Retrieval

The screenshot displays the Athenahealth interface for a 'Request Letter'. The top navigation bar includes the Athenahealth logo and a breadcrumb trail: 'Previous Page > Patient John Doe (01/01/1970) > eRequest 276271970'. Below this, there are tabs for 'Request Letter' and 'Medical Record'. The main content area shows a document viewer for '[Request Letter]' with a zoom level of 100%. The document text is a placeholder Lorem Ipsum. On the left, there are thumbnails of other documents. On the right, the 'Request Details' section lists: Patient Name (John A. Smith), Patient Date of Birth (01/01/1970), Date of Service (MM/DD/YYYY - MM/DD/YYYY), Request Type (Request Type), Requester Name, Due Date (MM/DD/YYYY Tomorrow), Delivery Method (Mail), and Deliver To (123 main st. New York, NY 10011). At the bottom right, the 'Pending Approval' section includes a '[help text]' link and two radio buttons: 'Approve' and 'Decline'.

Figma DRAFT of request detail page

Given a request ID, retrieve all available request metadata and associated documents.

Inputs

- erequest_id
- Athena user details

Required Outputs

- Patient Name
- Patient DOB
- Patient Sex
- Date(s) of Service
- Request Type
- Requester Name

- Due Date
- Status + any pend reason
- Document metadata + URLs or a method to retrieve:
 - Request Letter
 - Medical Records
 - Correspondence Letters
 - Certification letters (if these were uploaded by the practice and are not already appended to the RL)

Additional Expectations

- If the recommended access pattern for documents is through CDR, please let us know early so we can work towards getting CDR access as soon as possible

3. Exception Management Actions

DRAFT of some exception management actions

We need to enable the capability for Athena users to take actions to manage a request when it is in an exception state. See more details in the [exceptions table in the PRD](#).

3.1 Pending Approval

This includes requests for sensitive data, or incomplete, or unsigned notes for which an Athena user at the practice needs to review and approve or decline.

In Healthsource, this maps to the **Fulfillment Pend - HIMD Review** (or new status).

Inputs

- Request ID
- Athena user details
- Action: approve or decline

- Optional free-text comment (if decline reason given)

Output

- New request status (to refresh detailed view)

3.2 Certification

Practice uploads a signed certification form.

Inputs

- Request ID
- Athena user details
- Action: Approve (with certification upload) or decline
- On approval, send the signed certification document to HS
- On decline, support a free-text comment

Output

- New request status (to refresh detailed view)

3.3 Practice Retrieval

Practice uploads medical records manually. **(Assume for now that DV does not do any partial fulfillment)**

Inputs

- Request ID
- Athena user details
- Action: Upload or No records
- On approval, Document upload (medical records)
- On decline, user selects correspondence reason from list, which is then sent to HS

Output

- New request status (to refresh detailed view)

Additional Expectations

- If the recommended access pattern for uploading documents is through CDR, please let us know early so we can work towards getting CDR access as soon as possible

4. Audit Trail Requirements

HealthSource must allow the SMART app to record actions taken by Athena users so HS remains the system of record for accounting of disclosures.

Actions that must be recordable:

- Viewing an individual request
- Uploading documents
- Approving/declining in exception flows
- Any action that changes the state of the request

Required data to store:

- User name
- Athena user ID
- Timestamp
- Action type

5. Practice ↔ Site ID Mapping

The SMART App must be able to retrieve all ROI requests associated with an Athena practice. To do this, we need a reliable way to determine which HealthSource Site ID(s) correspond to the Athena practice and/or its departments.

This mapping is foundational for Phase 2

This may be:

- 1:1 (simple)
- 1:N (one practice → several HS sites)
- N:N (large systems with multiple practice/dept IDs per HS site)

Open Questions

- Can HS expose this mapping directly?
- How should many-to-many cases be resolved?
- Should mapping live in HealthSource, Data Foundation, or remain in Requester API?

Non-functional requirements

1. Scalability

- HS endpoints must handle **frequent polling** from many practices.
- Request lists may be large; pagination may be required.

2. Performance

- List retrieval should return within X ms
- Detail view within X ms

(Values TBD collaboratively)

3. Security + Compliance

- Authentication for SMART App traffic
- Single HS user role? Or one per practice? Identity for audit purposes can come from Athena
- Ensure all PHI transfer patterns meet compliance expectations

4. Reliability

- Clear error states for unavailable documents or unavailable statuses
- Idempotent exception-management actions

Open Items for Joint Discussion

1. **Do we need new HealthSource pend statuses** specific to EHR-integrated workflows?
2. **Audit updates for service user** can we add details from Athena on accounting of disclosure?
3. **Implications of polling:** how often can we call list endpoints without overwhelming HS?
4. **Document retrieval permissions:** is AOD required for list view, detail view, or both?
5. **Reporting enablement:**
 - % exception workflows resolved in-app
 - time to resolution
6. **Site ID mapping location + logic**
7. **API rate limits** or batching constraints. Would we do this at the practice level?
8. **Multiple documents** are there ever more than one medical records associated with a request?
9. **Support phone numbers** can we retrieve these dynamically from HS?
10. **Certification doc** if a user uploads a certification, does it get appended to the RL?
11. **New search/filter fields** is it complex to add additional support for new fields later?
