

HealthSource Performance & Stability Issues

Observations from virtual & on-site shadows

This month	10/2
 Internet is okay so far, but HS is slow like the people in monthly new...	10/1
 HS is kinda slow , working on DAR's	10/1
 HS is struggling down here as well. I'm getting the red X every so often...	
September 2025	9/15
 Yes, HS is working slow , working on it	9/15
 Those Dars appeared and HS is really slow here on site for the guys	9/8
 hs is just running slow right now	9/5
 HS IS SOOOOOOOOOOOOOOOOOOO SLOW	9/5
 hs is running slow	9/4
 shutting hs down to restart running slow	9/3
a 15 hs is driving me mad its running to ot tototototototot...	8/13

Search & Filtering

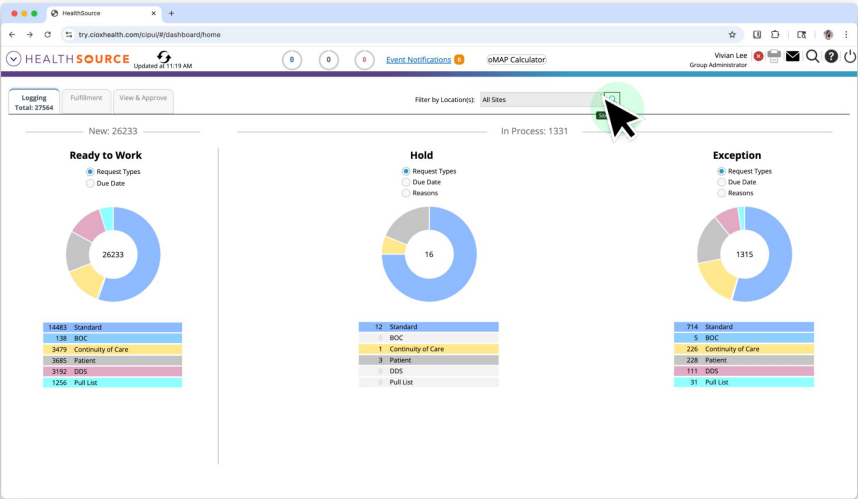

Site search window

When the request search window is opened (from the dashboard page), the system often freezes.

Ben Jones: Are they trying to search by group of sites? Or individual sites?

Ben Jones: We need a CDN (getting data from a network node closer to you). Serving data from dynamic serves – also causing it to be slow.

01

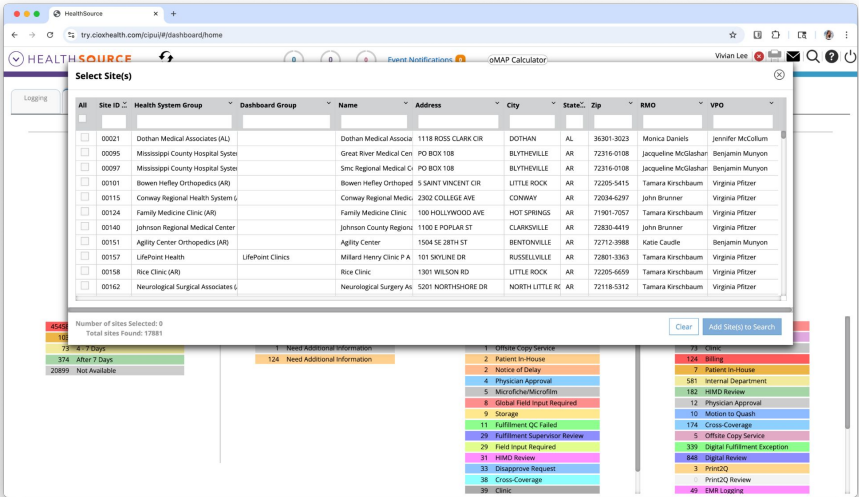

System slows down when request window is opened

Very frequently

- “Very frequently within VDI. Never when outside of the VDI”
–Danielle Sill
- “Happens often, may be impacted by connection method (VDI, hosp network, etc.)”
–Amy Reinertson

02

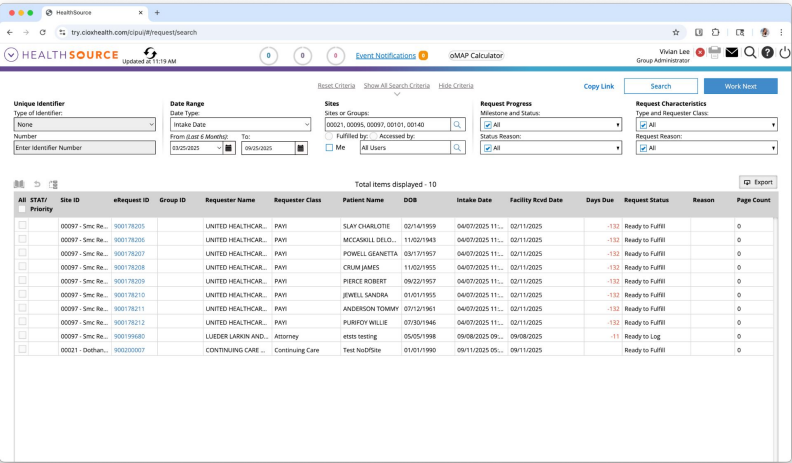

Occasionally

- “Typically seen when user has a larger number of sites”
–Nichole McPherson

Clicking search to filter down by sites / statuses

After filtering down sites and applying filters, the system slows down when the “search” is clicked

01

System slows down when search user clicks “Search”

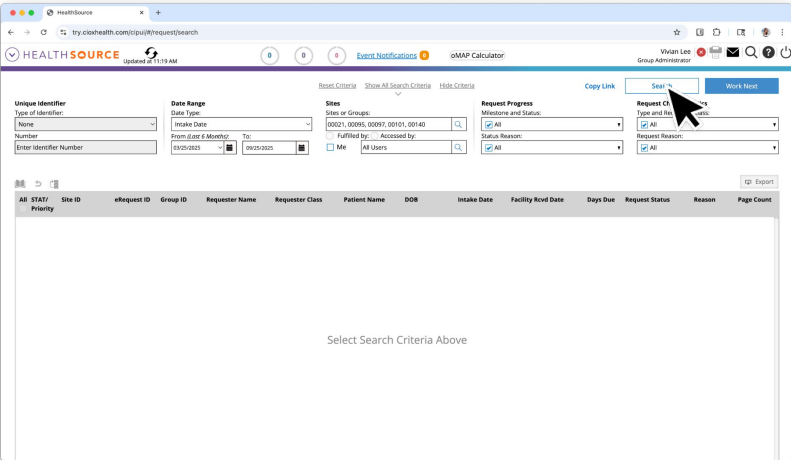

Very frequently

- Nichole cited a support ticket [Investigate Slow Search Performance at Partner Sites](#) –Nichole McPherson
- “Yes – filter will cause system to time out and you are stuck in piano keys of death” –Amy Reinertson
- Ryan Tappa has very frequently seen and experienced this too

Ben Jones: Has to do with volume of data being returned. They may want to download a set of requests too. SQL queries are not performant. Can we send less data? When users use the site, it gets slower and slower. Build up.

02

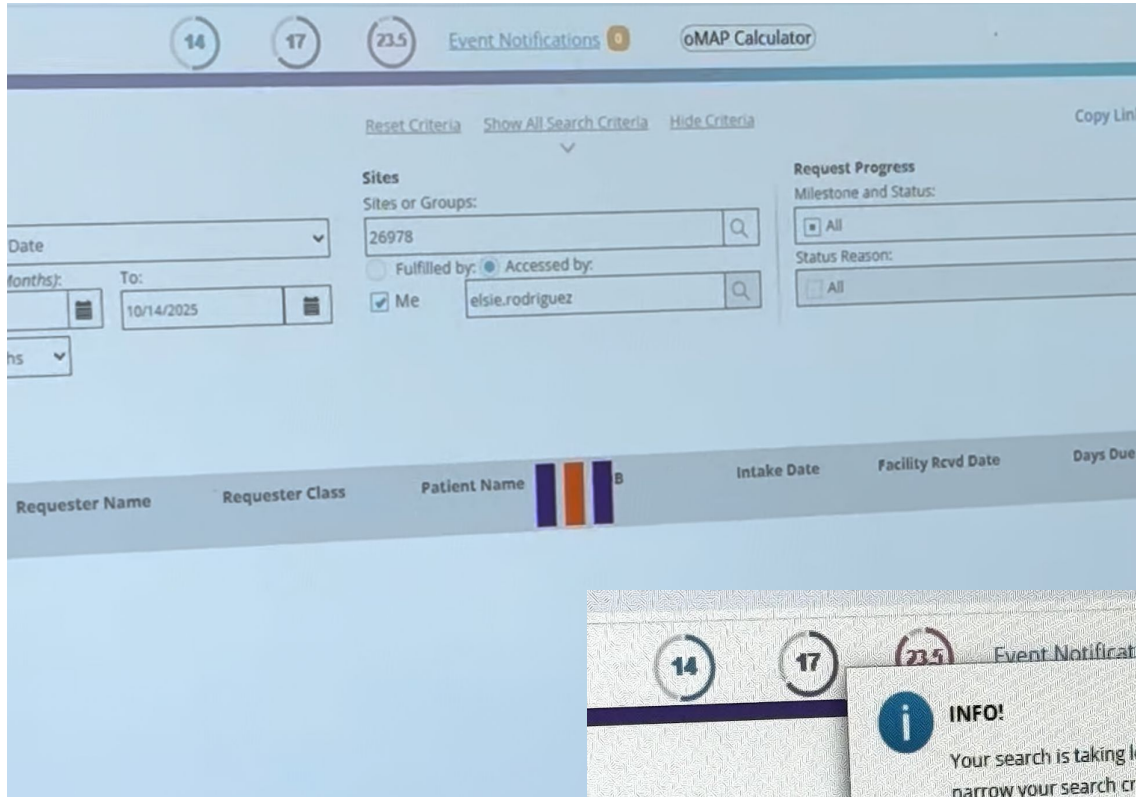

Occasionally

- “See it slow down if the site is very large. Takes a long time to search through and pull back results. If the sites aren't large, then it goes quickly.” –Danielle Sill

When “Me” box is checked during search

When processors want to view all the requests accessed by or fulfilled by “Me”, the system slows down or hangs up

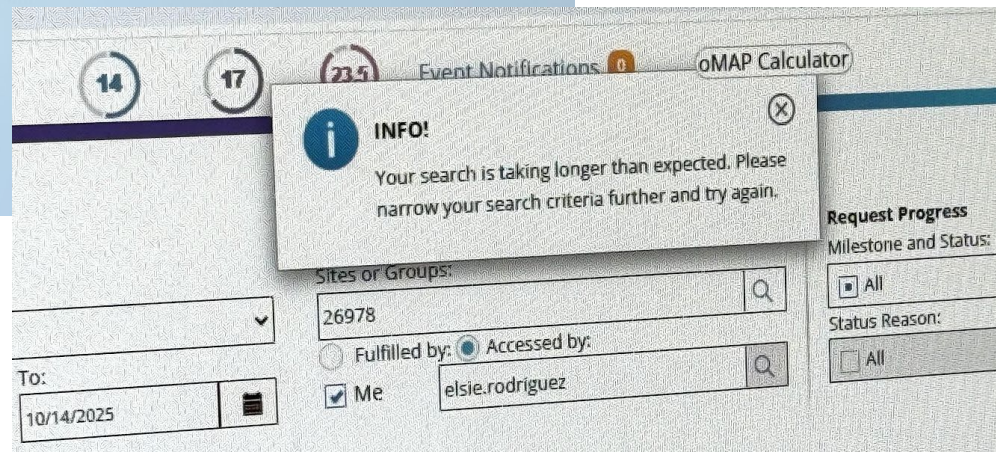

System slows
down when “Me”
box is checked

Occasionally

A few processors from Vanderbilt and UConn, as well as staff I observed onsite at HUMC (NJ), mentioned issues with the “Me” button. They said it used to work well and was a feature they really liked using a few months ago, but it’s now having problems.

Processors use the “Me” button to view the requests they’ve accessed or fulfilled, but the system often slows down or freezes when they do so.

One Site Assigned

Very frequently

- “One site assigned to the user (on and off issue). It gets fixed then broken. Only workaround is to assign a 2nd site to a user.”
–Nichole
- “The workaround is to assign demo site as a workaround. Can take forever to load, at least 30–40 seconds to populate because it’s searching for all sites.”
–Ryan

Get more context/color on this from team – confirm that the slowdowns happen during search.

Workflow Milestones

“Submit” after DAR (Digital Auth Review)

When processors click “submit” after DAR, the system slows down significantly before moving to next request

DAR Review → Submit

**QA (Quality Assurance)
QC (Quality Control)**

System slows down when “Submit”

Very frequently

- **“Absolutely very frequently happening.”** Sees this with the Ohio Health team – Healthsource takes a long time to think. (Amy)
- **“A really big one. May have to wait 20 mins for it to move on 3–4 incident tickets in 1 week and it had something to do with the duplicate checker.** Query has improved it and it’s faster now.” He has seen it with HCA, onshore & global team. (Ryan)
- **“This process was taking way too long. Global team would just sit there and wait. Same w/ CoC – there might be a single requester ID for all of California. While latency has improved, the degradation is recurring. How long before we get that same place again?”** (Nicole)

Ben Jones: There shouldn’t be a reason it should make you wait when you click submit. The way this works needs to be rethought. Once human is done doing step, should not make human wait. The system wants to validate everything before moving on.

“Submit” after Logging or Fulfillment

When processors click “submit” after logging, the system slows down significantly before moving to next request

Logging Request → Submit

System slows down when “Submit”

Very frequently

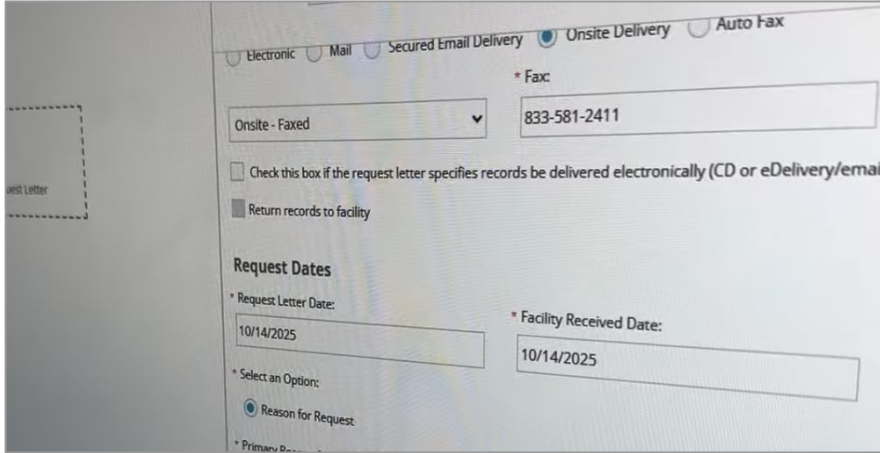

- “It’s happening. Engineers need to figure out what the factors are.” (Amy)
- “When it’s not connected to Trayapp, it can take a really long time.” (Ryan)
- “It can be impacted by other factors e.g. patient lookup can take several minutes” (Nicole)

SUCCESS: Request ID 900199012 submitted successfully

Logging

System freezes after certain form field inputs

When logging, system freezes with certain form fields (e.g. "Facility Receive Date") causing the user to restart

Electronic ☐ Mail ☐ Secured Email Delivery ☐ Onsite Delivery ☒ Auto Fax ☐

* Fax: 833-581-2411

Onsite - Faxed

☐ Check this box if the request letter specifies records be delivered electronically (CD or eDelivery/email)

☐ Return records to facility

Request Dates

* Request Letter Date: 10/14/2025

* Facility Received Date: 10/14/2025

* Select an Option:

☒ Reason for Request

* Primary Requester

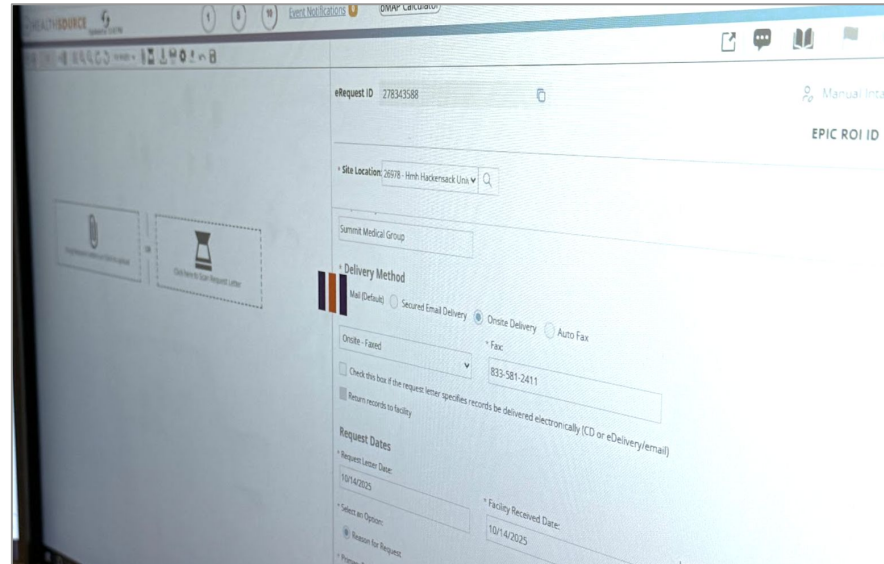

System slows down
after specific form
fields are entered

Occasionally

- **Experiencing slowness in both Logging and Fulfillment.** When entering data and moving quickly between fields using the Tab key, the form lags - she has to stop and wait for it to catch up. She uses a Windows-based device that's properly configured and has a wired internet connection with good speed **yet still sees slow performance when moving through form fields.** (Nicole)
- When Trayapp isn't properly connected, some **form fields (e.g. DOS) occasionally freeze** during logging. (Ryan)

Bitwarden issue
happening that's
slowing down
HS, especially in
pages with
forms.

Blocks
everything -
freezes the
entire
application

Request Dates

* Request Letter Date: 10/14/2025

* Facility Received Date: 10/14/2025

* Select an Option:

☒ Reason for Request

* Primary Requester

Slow Request Letter & Authorization Upload

Using Express ROI is often slow (~15–20 min for a single request sometimes)

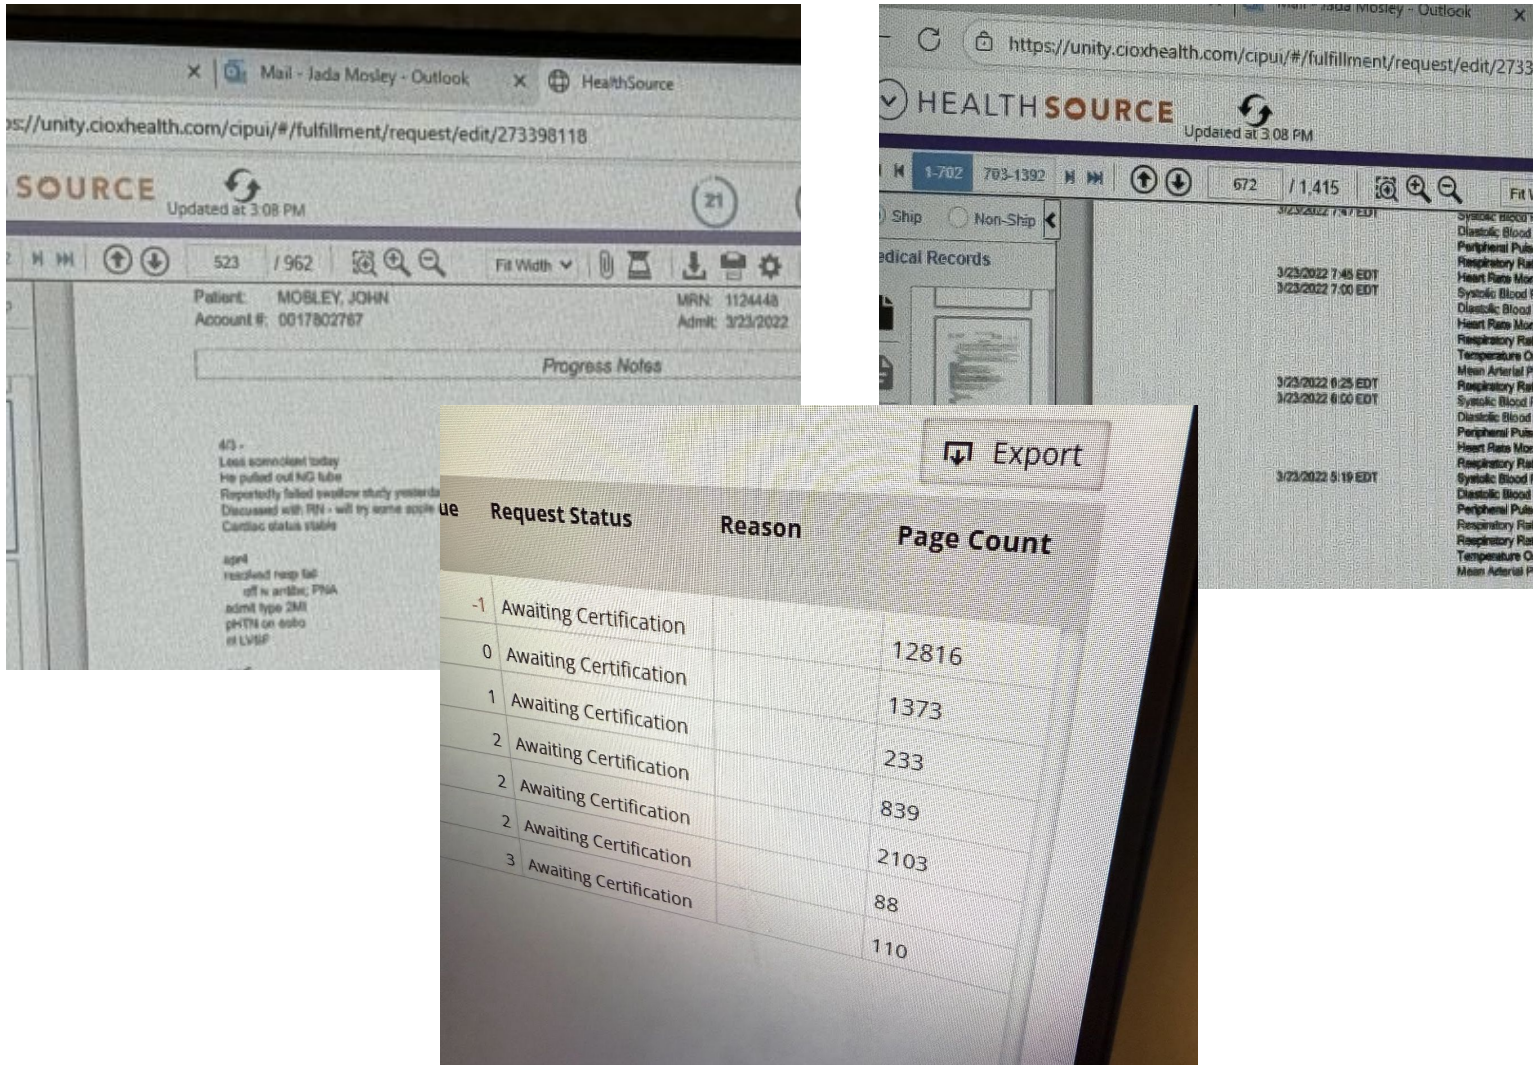

The screenshot shows the HEALTH SOURCE web application interface. The top navigation bar includes the logo, a refresh button, and several status indicators (0, 0, 0) next to 'Event Notifications' (12) and 'oMAP Calculator'. Below the navigation bar is a toolbar with various icons. The main content area is split into two panels. The left panel contains two dashed boxes: one with a paperclip icon and the text 'Drag Request Letters or Click to upload', and another with a scanner icon and the text 'Click here to Scan Request Letter'. The right panel displays the 'eRequest ID' (900199012) and a 'Site Location' dropdown menu. Below this is the 'Request Information' section, which includes a 'Request Type' section with radio buttons for 'Standard', 'Facility Internal (BOC)', 'Continuity of Care', 'Patient', and 'DDS'. The 'Standard' option is selected. There are also input fields for 'Zip' (Requester Zip), 'Address' (Requester Address), and 'Requester/Customer ID' (Enter text). A 'Find Requester' button is located next to the 'Requester/Customer ID' field. The 'Requester/Bill To' section includes input fields for 'Country' (UNITED STATES), 'Requester Name', 'Address 2', 'Address 3', 'State', 'Zip', 'Requester Type', 'Requester/Customer ID', 'Requester Status Email', and 'Additional Special Notes'.

- Observed this at the Boston Medical Center. A processor mentioned that sometimes request letter uploads can take 15–20 mins which is particularly frustrating in the mornings during walk-ins. –Vivian
- Don't really get tickets from HCA side around this; doesn't take a long time. Could be scanner related or network connectivity? –Ryan
- Something else underlying what that issue is. –Nichole

Fulfillment

Uploading large documents/charts

Significant slowdowns when uploading large documents/charts which often need to be batched (~500 pages)

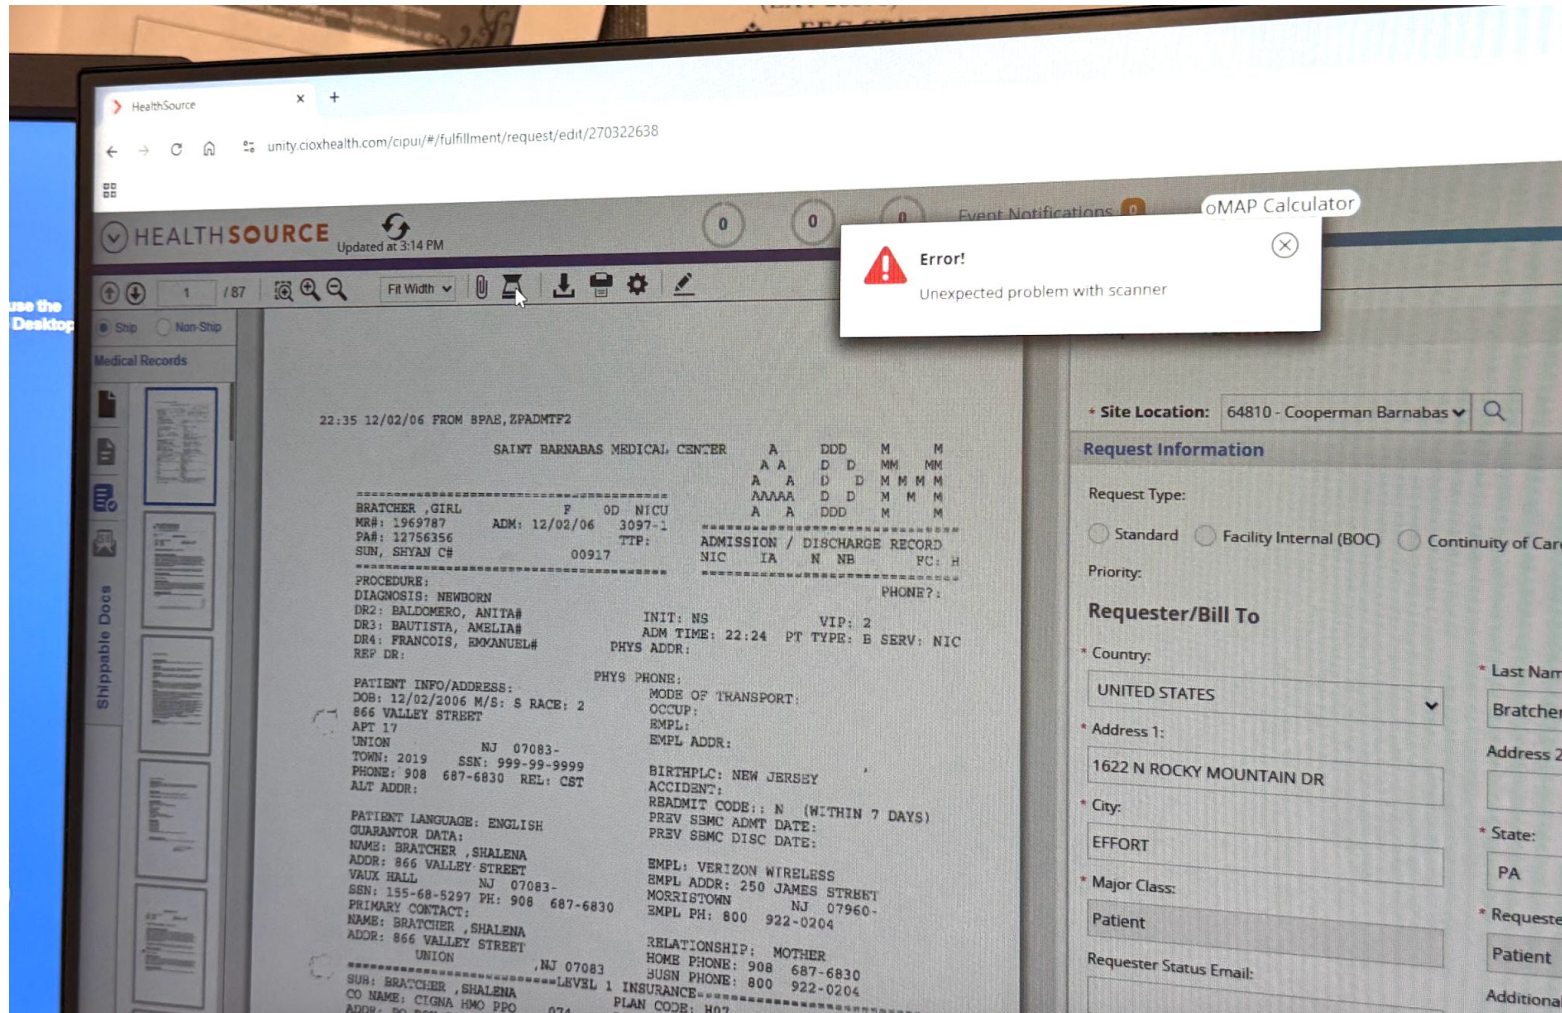

Very frequently

- The freezing doesn't just happen for large files but even files with no images. Slower to upload than it used to be. (Amy)
- Possible issue with DPI settings - may be using a higher DPI than needed. What files are being attached or printed? Is this through Epic via Citrix? Epic exports at 370 DPI but local setting is 100 DPI causing automatic compensation and potential delays. If the local settings is set to 200 DPI, that might help. (Nicole)
- I saw 30K to be the max file size a few years ago but now we're seeing 70-80K so it's only going up (Nicole)
- I've seen a request with 140K pages and they tried to accommodate by chunking it (Ryan)

Corrupt files require restarting full upload process

Files go corrupt easily, often when scanning which forces the processor to restart the upload process

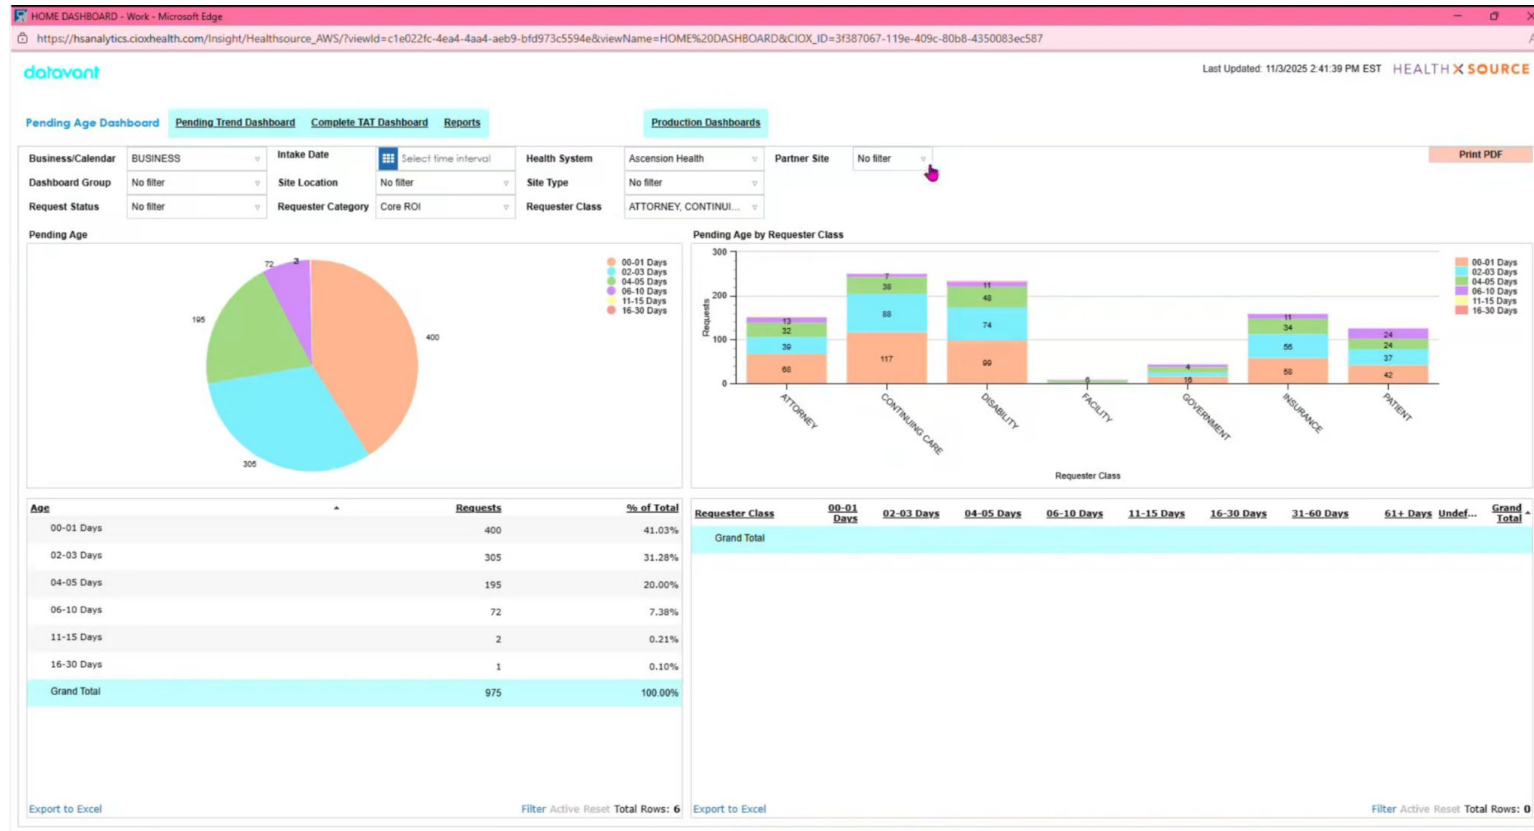

Occasionally

- There are tickets for review on this pending resolution. Our AP needs reviewed for an overhaul (we've been asking for years) -Nichole

Reporting

Report exports take a long time

Report exports can take a long time (e.g. a 6 month time range can take 15 mins or more)

Occasionally

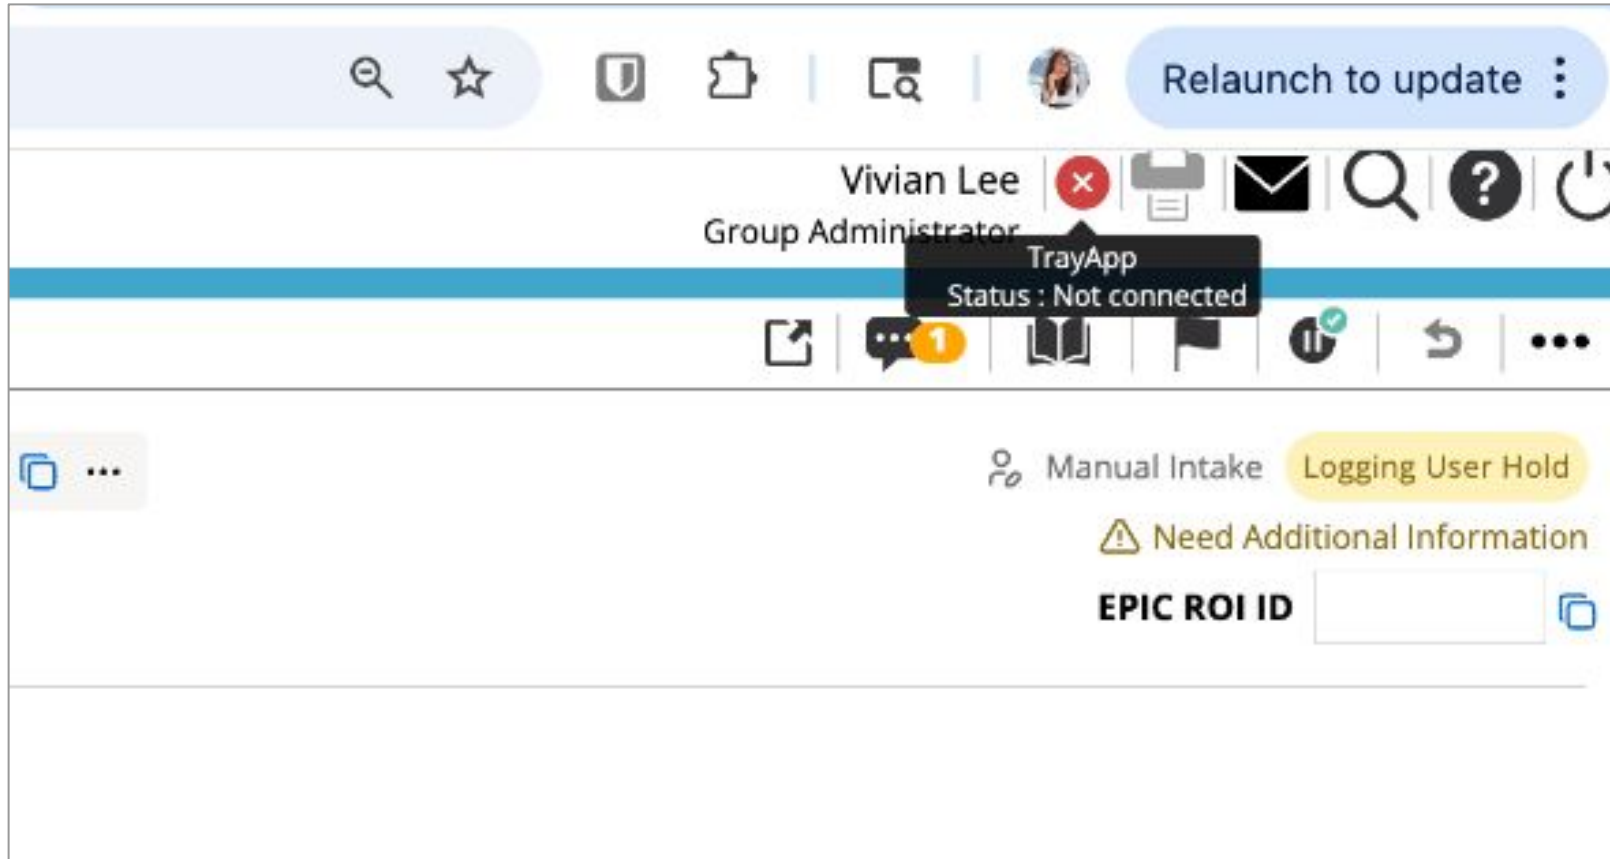

- There's a major delay in data sync (5+ hours standard). Poor structure for reports. (Nichole)

Overall

Overall

Trayapp / VDI issues

Trayapp / VDI issues cause system slowness and freezing

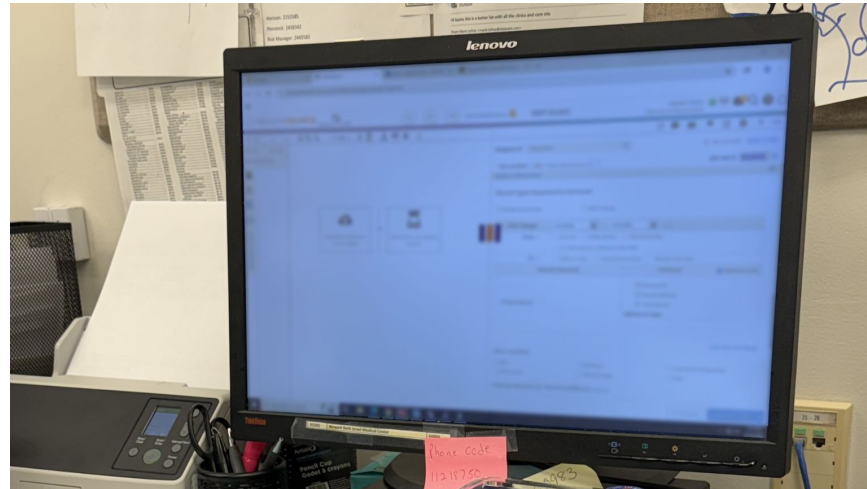

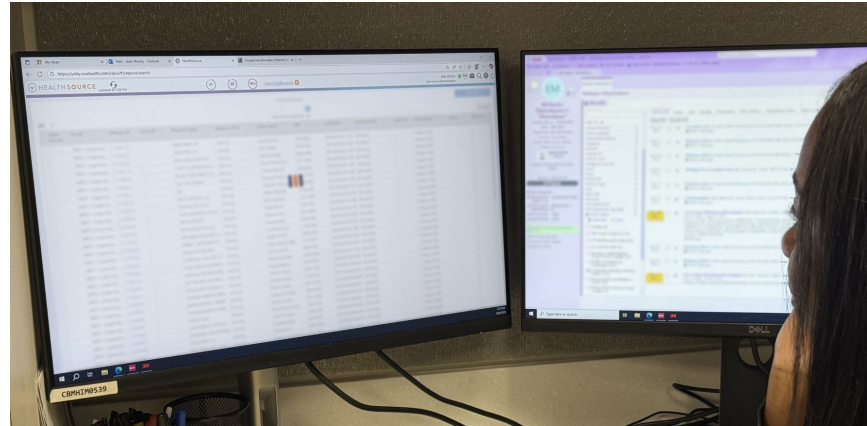

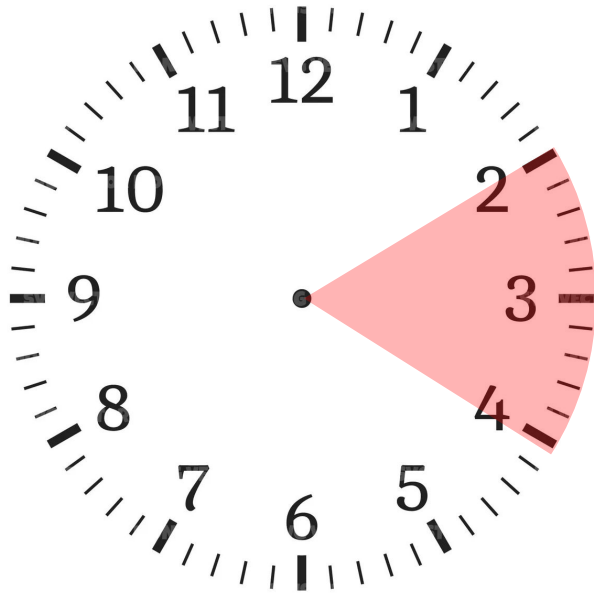

Very frequently

- This is a big theme across all issues. If VDI/trayapp isn't working, how do we know if it's Healthsource-related or VDI/trayapp related?

Overall

Peak Hour Slowdowns

System degrades during peak hours (~2-4pm EST)

Reported at every single on-site visit
(RWJ Barnabas, Newark Beth Israel,
Boston Medical Center, HUMC)

Other Issues

Nichole – the moving of requests to certification needed.

Claim Number validation checks that are preventing Submit and Next or Close – HEAL-1014

Intake Delays

Amy – intake delays for all intake vectors are causing MASSIVE issues with SLA and TAT.

Multiple way to get request letters in HS – put request letters in (print & scan, email, fax) – takes hours for requests to make it into our backend systems. Can take hours. We're blind to it. End users have created creative workarounds in order to meet SLAs. They're no longer putting into HS. Made up their own workflows b/c system slowness.

Missing TAT & SLAs because of this.
